Toronto :

PRINTED BY WARWICK & SONS, 68 AND 70 FRONT STREET WEST.  
1888.

REGISTRAR GENERAL'S OFFICE, ONTARIO,  
TORONTO, December 1st, 1888.

*To His Honour Sir Alexander Campbell, K.C. M.G.,  
Lieutenant-Governor of the Province of Ontario:*

MAY IT PLEASE YOUR HONOUR:

In compliance with the Statute in that behalf, the undersigned respectfully presents to Your Honour the Annual Report of Births, Marriages and Deaths for the year ending 31st December, 1887.

Respectfully submitted,

CHARLES DRURY,  
Registrar-General.

# CONTENTS.

	PAGE.
Total Registrations of Births, Marriages and Deaths in 1887.....	1
Births.—Extracts from the tables, shewing the number and ratio.....	1
“ “ “ increase and decrease in the different Counties and Cities.....	2
“ “ “ number in each sex, and the excess of males over females.....	2
“ Remarks on the number of, in the different seasons.....	2

“ 19.— “ ten highest causes for 11 years.....	25-27
“ 20.— “ “ in each County.....	28-29
“ 21.— “ “ in each City.....	30-31
“ 22.— “ “ in each Town.....	30-31
“ 23.— “ five highest causes in each period of life.....	32
“ 24.— “ by occupations, classified in each quinquennial period of life.....	33-35
“ 25.— “ recapitulation of table 24.....	33-35

The registration of births shew a decrease of 554 in number. Of this falling off one county (Carleton) alone shews a decrease of 485, although twenty other counties have returned less births, but not to so great an extent. In the remaining nineteen counties it is pleasing to notice increased registration of births, the most noticeable were York with 149; Frontenac with 124; Lennox and Addington, (united) and Brant with 94 each; Muskoka and Parry Sound with 85; Waterloo with 67; Bruce with 66; and Peterboro' with 62. The following counties were the most prominent for decreased returns: Carleton, 485; Ontario, 144; Oxford, 93; Renfrew, 92; Leeds and Grenville, (united) 78; Hastings, 74; Victoria, 71; Lincoln, 63, and Peel, 62. The decreases in the other counties were comparatively small. It should, however, be remarked, that the counties reported above as having returned less births in 1887 than in 1886, returned in every case (except Lincoln) in 1886 large increases over the number returned in 1885.

There was also a falling off in the returns of births in the cities, principally in Ottawa, which returned 376 less than in 1886, St. Thomas, St. Catharines, Lincoln and Stratford combined, a total of 108 less, while in the remaining cities there were large increases, especially in Toronto, with 215, Kingston with 173, and London with 86.

The increases and decreases in the towns very nearly balance, shewing 16 more births than in 1886—the largest increase was in Cobourg, viz., 58, and the greatest decrease in Chatham, 42.

## SEX.

(See Tables 4 and 5).

The male births numbered 23,859, and the females 22,045, an excess of 1,814 males. An excess of male births in the Province appeared in every month of the year, though more particularly in the months of June and December. The smallest difference was in November, being only two per cent. more males. Separating the cities from the Province the difference was more marked in every month, except in April, in which month the female births exceeded those of the males. The month of June shewed the largest excess, 64.

Table 5 has been compiled for the purpose of shewing the excess of male births during the last ten years. There was a total of 224,044 male births to 207,757 females, a proportion of 107.8 males to 100 females.

## MONTHLY AND QUARTERLY.

(See Tables 6 and 7).

It seems to be the uniform rule for the largest number of births to occur in March, and the smallest number either in November or December. The difference between the highest number recorded in March, 1887, and the lowest in December, was 911. In births by quarters, the first and third quarters returned the largest numbers, and the second and fourth the least. These proportions have been the same for a number of years.

## PLURAL AND ILLEGITIMATE BIRTHS.

(See Table 8).

Twin births were not so numerous in 1887 as in 1886, as only 303 pairs were registered in the former year, while in the latter year 375 pairs were recorded. No cases of triplets appear to have been returned. In 1886 there were three cases.

A very large decrease, viz., 275 has taken place in the number of illegitimate children registered in 1887, chiefly in the counties of Carleton, Middlesex, Wentworth, and York; the total decreases in these four counties number 207. Evidently these births were not as fully registered as in former years, as the average for the ten years preceding 1887 was 693 per year.

## MARRIAGES.

(See Tables 1, 2 and 3).

The marriages registered in 1887 numbered 14,460 or 6.8 per 1,000 of the population, an increase of 615 couples married. In the cities 3,447 were registered, 11.1 per 1,000, an increase of 147; and in the towns the marriages were 1,656 or 13.7 per 1,000, an increase of 312 over the number of marriages celebrated in 1886.

## DENOMINATIONS.

(See Table 9.)

The Methodists, as usual, head the list, notwithstanding that there was a small decrease in comparison with 1886; they numbered 10,242 or 35.4 per cent. of all the persons married. The Presbyterians returned 5,810 or 20 per cent.; the Episcopalians 5,052 or 17.5 per cent., and the Roman Catholics 4,160 or 14.4 per cent.

There was an increase in the number of persons married in each denomination except Methodists and Mennonites.

## MONTHS.

(See Table 10).

October and December still retain their prestige of being the favourite months for entering the married state. Of the 14,460 marriages, 3,132 or 21.6 per cent. were solemnized in these two months, whereas in May only 875 marriages, or 6.5 per cent., were celebrated. For a number of years previous to 1887, August always returned the lowest number of marriages.

## AGES.

(See Table 11).

It will be seen from this table that in only two periods of life, viz., (under twenty years and from twenty to twenty-five years) did the females exceed the males; but the excess was very great, 2,664 persons were married under twenty years of age. Of these 2,533 were females and only 131 males; in the period between twenty and twenty-five years 12,074 persons were married, of whom 7,035 were females and 5,039 were males. In the other twelve periods the proportion was in favour of the males.

The following abstract shews the percentage of each sex to the whole number married in the different periods of life:

Males under 20 years when married .9 per cent.				Females 17.4 per cent.

---

MARRIAGES AT 70 YEARS AND OVER.

(See Table 12).

There were nine bridegrooms who were seventy years of age when married and fifteen between that age and ninety years. The oldest of them had reached the patriarchal age of eighty-nine years when he took for a partner an old lady of the age of eighty years, their united ages were 169 years, exceeding the total age of the oldest couple registered in 1886 by nine years, which ranks them as the oldest couple married in Ontario up to this time. This old couple were married in the county of Essex. Three brides of seventy years and over were older than the bridegrooms. The greatest disparity between the ages of the bride and bridegroom was in the case of a man aged seventy-four years who married a girl of twenty years.

## YOUTHFUL MARRIAGES.

Several instances of girls marrying at very tender years were returned, viz., one marriage was reported from Algoma in which the child bride was stated to have been only thirteen years of age, while the age of the husband was given as twenty-two years. Four girls were married at fourteen years, and twenty-seven at fifteen years. The boys were not in so much haste to marry, as the returns do not shew that any of them were married under eighteen years of age, and only twenty were married at that age. The united ages of the youngest couple married was thirty-three years, the bridegroom was eighteen and the bride fifteen years.

# EXPLANATIONS OF THE DIAGRAMS AND REMARKS ON THE VARIOUS DEATH TABLES.

## EXPLANATION OF THE DIAGRAMS.

### *Diagrams 1 and 2.*

The mortality in the Province, in the cities, in the towns and in the rural districts are indicated in these diagrams by the following different lines :—

..... for the Province.  
 ————— “ “ Cities.  
 - - - - - “ “ Towns.  
 + + + “ “ Rural Districts.

Diagram No. 1 shews the deaths in each month of the year in each of the four localities.

Comparing the mortality in these localities, it will be seen that the two highest points in the death-rate in the Province were in January and March, and in the rural districts the two highest points were also in the same months. In the Province, the month of March indicated the highest mortality of the two points, and in the rural districts the month of January held the same position. In the cities the two high points were in July and April, the point in July shewing the highest.

In the towns the points in August and July were the two highest, the point in August being higher than the one in July.

The two lowest points of mortality in the Province were in June and November, June shewing the lowest of the two points, and in the rural districts the points of mortality were also the lowest in the same two months. In the cities the two lowest points were in October and November, and the difference between them was only 50 deaths.

The lowest points of mortality in the towns were in May and June, the point in the latter month being the lowest.

Diagram No. 2 exhibits the death wave in the different periods of life. The greatest mortality in any period was under one year, but this excess of deaths decreased very rapidly through the periods from 1 to 5, 5 to 10, and 10 to 15. In the period between 15 and 20 years the wave commenced to ascend, and reached a high point between 20 and 30 years. It, however, again descends through the next two periods. In the period between 40 and 50 years it again ascends, and continues ascending until it reaches the highest point of mortality since infancy, viz., between 70 and 80 years.

Diagrams 3 and 4 present a comparison of the death-rate from the four causes of death, viz., “old age,” “lung disease,” “fevers” and “diphtheria,” in each of the four localities.

The following summary is here given :—

### OLD AGE.

In the	Province	the greatest	mortality was in	April; the least in	July.
“	cities	“	“	“	“
“	towns	“	“	“	“
“	rural districts	“	“	“	“

### LUNG DISEASE.

In the	Province	the greatest	mortality was in	April; the least in	July.
“	cities	“	“	“	“
“	towns	“	“	“	“
“	rural districts	“	“	“	“

" cities	"	"	"	February.
" towns	"	"	"	September.
" rural districts	"	"	"	September.

## DEATHS.

## PROVINCE.

*No. of Deaths, 23,414 ; ratio to Population, 11.5 per 1,000.*

The Mortuary Statistics of the Province for 1887 shew very little variation from those of 1886 as regards numbers ; the difference was only 230 more. In 23 counties there was an increase, and in the other 17 a decrease. The county of Bruce returned an increase of 88 ; Elgin, 50 ; Grey, 51 ; Hastings, 171 ; Huron, 98 ; Kent, 56 ; Middlesex, 60 ; Northumberland and Durham (united), 69 ; Oxford, 68 ; and Simcoe, 64. Altogether there was an increase of 1,132 in the 23 counties ; the remaining counties returned a decrease of 902, therefore the actual increase was as above stated, 230. The counties returning the largest decreases were Carleton, 261 ; York, 168 ; Leeds and Grenville (united), 124 ; Norfolk, 61 ; Prince Edward, 47, and Renfrew, 43. Fifteen counties returned an equal or higher ratio than the average for the whole Province. The ratio was low in the comparatively newly organized counties in consequence of their being sparsely settled, and the facilities for registration not being equal to those in the older settled ones. It should not, therefore, be assumed that the low death-rate returned by these counties was an indication that they were healthier than in those counties which returned a higher death-rate.

## CITIES.

*No. of deaths, 5,896 ; ratio, 19 per 1,000.*

The deaths in the eleven cities numbered 5,896, a decrease of 454 from the number registered in 1886.

Four cities, London, Kingston, St. Thomas and Belleville returned a total increase of 81 ; whereas, in the seven other cities, there was a total decrease of 535. The actual decrease was therefore 454, as above stated. The returns from Toronto shew a decrease of 162 deaths ; Hamilton, 81 ; Ottawa, 260 ; and Stratford, 25. The ratio per 1,000 living has also fallen off in the cities from 21.2 per 1,000 in 1886 to 19.0 per 1,000 in 1887, caused by the increase in the population and decrease in mortality. Ottawa still returns the highest death-rate, 22.3 per thousand, and Stratford the lowest, 11.2 per 1,000.

## TOWNS.

*No. of deaths, 1,604 ; ratio to population, 13.3 per 1000.*

The returns from the towns shew that the total mortality was 28 less than in 1886. The total population as given by the assessors has also decreased by 724 ; consequently, the average ratio of deaths was also less, being 13.3 as against 14.3 per 1000 in 1886. In some towns, however, the death-rate still remains high, considerably more than the average. The death-rate in Brampton was 21.2 per 1,000 ; in Whitby, 19.6 per 1,000 ;

in Galt, 16.1 per 1,000 ; in Napanee, 16.2 per 1000, and in Kincardine, 15.1 per 1,000. In Whitby and Galt, diphtheria and diarrhoeal diseases were more than usually prevalent. In Napanee, although the population was reported as being less than in 1886, the number of deaths remains nearly the same, causing the ratio to increase. In Brampton and Kincardine the ratio has for several years been high.

## SEX.

(See Tables 14 and 15.)

These tables shew that 12,203 males and 11,211 females died, a difference of 992. The proportion was 108.8 males to 100 females ; therefore, the excess of male over female births, 108.2 to 100 was more than equalled by the excess of male over female deaths. Table 5 exemplifies the proportions of the sexes for ten years.

The following extracts from the Registration reports of England, Ireland and five States of the American Union in reference to the proportion between the sexes, are here given :

COUNTRY.	BIRTHS.		DEATHS.	
	Excess of Male births.	Proportion of male to female births.	Excess of male deaths.	Proportion of male to female deaths.
Ireland.....	17,074	103.8 males to 100 females	Excess of 14,472 mal's	105.5 males to 100 females.
England.....	2,590	104.7 " " "	" of 763 females	107.7 females to 100 males.
Min'sota, U.S.	1,190	107.7 " " "	" of 1,002 males	118.9 males to 100 females.
Michigan, "	1,632	108.2 " " "	" of 1,323 "	115.7 " " "
Mas'ch's'ts, "	1,337	105.6 " " "	" of 516 females	101.6 females to 100 males.
Con'ectic't, "	735	109.8 " " "	" of 163 males	102.9 males to 100 females.
Rhode Is'd, "	235	107.2 " " "	" of 82 females.	103.3 females to 100 males.
Ontario.....	1,814	108.2 " " "	" of 992 males..	108.8 males to 100 females.

From these extracts it will be observed that the excess of male births was greater than in Ontario in only one locality, viz., Connecticut.

The proportion between the death of males and females was different. In Ontario the proportion was nearly the same as that of births. In Minnesota and Michigan it was much greater ; in nearly all the other places the proportion was less than in the births, and in three places, Ireland, Massachusetts and Rhode Island there was an excess of female deaths. The Registrar-General of England on this subject remarks : " The contrast between the male and female mortality has been gradually becoming more and more unfavourable to the former sex, probably because the increasing strain of competition tells more heavily upon men than upon women."

The excess in the mortality of males in the whole Province was the greatest in the periods "under one year" and "1 to 5," whereas the greatest excess of females was between the ages of 20 and 40 years. In the former there were 4,311 male decedents to 3,483 females, a proportion of 123 males to 100 females. In the latter period the deaths numbered 2,034 females to 1,640 males, a proportion of 124 females to 100 males. In the cities the proportion was 1,373 males to 1,098 females in the periods "under one year" and "1 to 5 years," a proportion of 125 males to 100 females ; between 20 and 40 years the deaths of males and females were nearly the same, 459 females to 456 males. In the towns, during the periods between 20 to 40 years, the proportions of the sexes were the same as in the Province, viz., 123 males to 100 females ; between 60 and 80 years the proportion was much greater, viz., 157 males to 100 females.

## SEASONS.

The months of March and April generally return the highest mortality in the Province. September was second in 1886, this was quite unusual, as in previous years it ranked low down in the order of deaths by months. In every year June returns the

fewest deaths, and may therefore be looked upon as the healthiest month in the year. In the cities July was the most fatal month, caused probably by the mortality from diarrhoeal diseases, which were prevalent during that month. The healthiest month in the cities was October.

#### AGES.

(See Table 16).

The mortality of children under the age of one year was 48 more than in the previous year. There was, however, a large decrease in the deaths between one and five years, viz., 352. The total deaths in these two periods numbered 7,794, a decrease of 304. There was also a decrease of 43 in the number of deaths between 5 and 10 years. There was an increase, however, of 473 deaths at ages varying from 50 years to 100, which shews that the length of life in the Province has not become shortened but rather increased.

In the cities the mortality of children under one year was 213 less than in 1886, while there was also a decrease in the periods between 1 and 5 years of 322, which shews a total decrease of 535 deaths under 5 years of age. It is pleasing to note this decrease of infant mortality.

The deaths under five years in the towns was less than in 1886 by 53, while there was a small increase in the number of deaths over 50 years of age.

#### CENTENARIANS.

(See Table 17.)

The particulars of the deaths of 24 patriarchs of 100 years and over (the same number as in 1886) are given in Table 17.

Three were reported as having lived to be 110 years. Enquiries made of the relatives have failed to elicit satisfactory answers that these persons lived to so great an age.

#### NATIONALITIES OF DECEDENTS OVER 60 YEARS OF AGE.

(See Table 18.)

The deaths of those who were over sixty years of age at the time of their death numbered 5,804, and this table particularizes the country of their birth, the largest proportion of them, 1,670, were born in Ireland; Canada was the birth place of 1,228 of them; 1,145 were born in England; 974 in Scotland; 328 in the United States; 228 in Germany; 29 in France; 14 in Switzerland, and the remainder in other countries.

#### CAUSES OF DEATH.

(See Appendix Table E.)

In former reports this table contained the names of 159 causes of death, classified under five different divisions. It was considered that by grouping the different nomenclature of a disease under one general term, and giving that term its simplest form the number of diseases given in the table would be very much decreased and the statistics prove more attractive to the general reader. The ages of the decedents and the months in which they died, also the causes of death, are given concurrently for each county, city and town, which could not be given in the tables of previous years. The following will illustrate the system adopted: In previous reports fevers were divided into several different heads as follows: "Febris Biliosa," "Febris Cerebro Spinalis," "Febris Congestiva," "Febris Intermittent," "Febris Remittens," "Febris Typhoides," and "Scarlatina." In Table E in this report all the deaths from the seven different kinds of fever are grouped under the headings of Typhoid Fever, Scarlet Fever and "other fevers." This system of concentration has been carried out in all the classification of diseases, reducing the number of diseases given in the counties, cities and towns to 24 in each locality.

## TEN HIGHEST CAUSES OF DEATH.

(See Tables 20, 21 and 22.)

## OLD AGE.

*No. of Deaths, 2,617.*

This natural cause of death heads the list in the whole Province and also in the towns. In the cities it was the sixth cause of death.

The ratio to population was as follows :

For the whole Province.....	1.23	per 1,000
“ cities .....	1.2	“
“ towns .....	1.4	“
“ rural districts .....	1.2	“

The highest death-rate returned from Old Age in the counties was from Frontenac and Prince Edward, 1.8 and 1.7 per 1,000 respectively. Kingston and Belleville returned the highest rate of the cities, and Whitby and Berlin of the towns. There was an increase of 496 deaths from this cause over 1886.

## PHTHISIS (CONSUMPTION).

*(No. of Deaths, 2,556.)*

This disease appears second on the list for the Province with an increase of 137 deaths ; it was also the second highest cause in the cities and towns.

The ratio to population was as follows :

For the whole Province.....	1.2	per 1,000
“ cities .....	1.9	“
“ towns .....	1.2	“
“ rural districts .....	1.07	“

For many years this disease has been the highest cause of death. In the cities there was a decrease in the number of deaths from Phthisis of 52 and also in the towns of 45. In the counties the highest mortality was from the counties of York and Wentworth ; in the cities from Hamilton and Belleville, and in the towns from Kincardine and Barrie. The most fatal period of life from this cause has always been between the ages of 20 and 40 years and remains so in 1887.

The season which returned the greatest mortality from this disease was generally in the first three months of the year in the Province. In the cities the second quarter shews the season of greater mortality.

## PNEUMONIA (INFLAMMATION OF LUNGS.)

*No. of Deaths, 2,289.*

Under this heading are included all lung diseases and Bronchitis ; together they caused the third highest number of deaths in the whole Province. In the cities and towns they occupy the fourth place.

The ratio to population was as follows :

For the whole Province.....	1.08	per 1,000
“ cities .....	1.8	“
“ towns .....	1.1	“
“ rural districts .....	.9	“

By this it will be seen that Lung diseases were most prevalent in the cities and towns. The distribution of mortality from Pneumonia in the different counties was very unequal, not only in the percentage to the whole number of deaths in each county, but also in proportion to the population. The table shews that it ranged from 2.1 per 1,000 in Wentworth to .3 per 1,000 in Norfolk. In the cities where the deaths from this disease were generally numerous, the same inequality prevails, viz., from 2.1 per 1,000 in Toronto to .9 per 1,000 in Brantford. The distribution was still more unequal in the towns. In Cobourg it was 3.3 per 1,000 and varied through the different towns from that ratio to .1 per 1,000 in Cornwall. Nearly forty per cent. of the deaths from these diseases occurred in the first quarter of the year and 27 per cent. in the second quarter, so that 67 per cent. of the deaths was in the first six months of the year.

The table also shews that 526 of the deaths in this class were of children under one year; and 280 were between one and five years; therefore 816 died under five years from diseases of the lungs.

#### NERVOUS DISEASES (DISEASES OF THE BRAIN.)

*No. of Deaths, 2,157.*

Under this division were included all the different affections of the Brain. They appear to be increasing, particularly in the cities and towns. They stand fourth in order of mortality in the whole Province, first in the cities and third in the towns.

The ratio to population was as follows :

For the whole Province.....	1.02 per 1,000
“ cities .....	2.00 “
“ towns .....	1.2 “
“ rural districts .....	.7 “

The deaths of children from Convulsions are included under nervous diseases, and the larger mortality of infants under one year in the cities and towns accounts in a great measure for the high death-rate from nervous diseases in those localities. The ratio to population of children dying under one year in the cities was 7.8 per 1,000; in the towns 2.8 per 1,000, whereas in the rural districts it was 1.2 per 1,000.

The early months of the year returned the highest number of deaths from these diseases. March returned the highest number, viz., 216 deaths, and November the lowest, viz., 149 deaths. In the cities the season of greater mortality was during July, August and September.

#### ANÆMIA (GENERAL DEBILITY.)

*No. of Deaths, 2,034.*

This cause of death (the fifth in the class) was principally confined to the young and old, and was generally given as the cause of death to those who died from general debility and without any specific disease.

Ratio to population :

For the whole Province.....	.9 per 1,000
“ cities .....	1.6 “
“ towns .....	1.1 “
“ rural districts .....	.8 “

Infantile Debility included in Anæmia was the cause of the greater mortality in the cities and towns, the returns shewing that of the 509 deaths from Anæmia, in the cities, 392 were of infants under one year, the cause being given as (Infantile Debility”) and the same excess was shewn from the towns, 103 out of 135 deaths. More deaths from Anæmia took place during the months of July and August than in any other two months of the year.

## HEART DISEASES (INCLUDING APOPLEXY.)

*No. of Deaths, 1,456.*

Diseases of the heart have increased so much that they have become an important factor in the causes of death. It was sixth in the order of largest mortality in 1887 for the whole Province, third for the cities, and sixth in the towns.

Ratio to population :

For the whole Province . . . . .	.7
“ cities . . . . .	1.3
“ towns . . . . .	.9
“ rural districts . . . . .	.5

The mortality from these diseases were confined principally to those who had passed the meridian of life, as 906 or 62 per cent. died between 50 and 80 years of age. There does not appear to have been much variation in the number of deaths recorded during the different months of the year from these diseases ; the second quarter of the year was slightly less fatal than the other three quarters.

## DIPHTHERIA.

*No. of Deaths, 1,340.*

The number of deaths from this disease in 1887 was 1,340, a decrease of 66 deaths, causing it to recede from the fifth to seventh place in the list of ten highest causes of death.

Ratio to population :

For the whole Province . . . . .	.6 per 1,000
“ cities . . . . .	1.1 “
“ towns . . . . .	.8 “
“ rural districts . . . . .	.5 “

The ratio to population of this disease in the different counties was varied. In one of them, Prescott and Russell (United), the ratio was as high as 2.1 per 1,000, while in six counties it was not above .2 per 1,000, and in the county of Prince Edward no deaths were recorded from this cause. In 16 counties the ratio was above the average, and in 24 below it.

In the cities the mortality was greatest in Toronto and Guelph, 1.5 and 1.6 per 1,000 respectively. Ottawa and London were nearly as great, 1.1 per 1,000 each.

In Belleville no deaths were returned from this disease, and in Kingston and St. Catharines only five and three deaths respectively.

Diphtheria was very prevalent in several of the towns in 1887, principally in Whitby, Napanee, Woodstock, and Pembroke, the table shewing that the death-rate was 3.1 and 3.0 per 1,000 respectively in Whitby and Napanee ; and 2.5 and 1.9 per 1,000 in Woodstock and Pembroke. In contrast to this severe mortality it will be observed that none of the deaths from the towns of Kincardine, Owen Sound, Perth, Picton, and Port Hope were caused through Diphtheria. The deaths of 130 infants under one year were recorded, the mortality, however, was almost exclusively confined to the period between the ages of one and fifteen years as the returns shew that out of the total deaths from diphtheria (1,340), no less than 1,105 died during that period. There were a few deaths from this cause at 60 years and over.

The last quarter of the year was the most fatal season for this disease, as 429 deaths, nearly 30 per cent. of the whole, occurred during that period. The third quarter appeared to have been the least fatal from this cause, as only 239 deaths, or 17 per cent., were returned during that quarter.

## ENTERITIS AND GASTRITIS (INFLAMMATION OF THE BOWELS AND STOMACH.)

### *No. of Deaths, 854.*

Under this heading were included all diseases of the bowels and stomach. They stand eighth in the list for the Province, and last in the cities and towns.

The ratio to population was as follows :—

For the Province.....	.4	per 1,000
“ cities.....	.7	“
“ towns.....	.4	“
“ rural districts.....	.	“

The majority of the deaths from the diseases included under Enteritis were of those over 30 years of age, though 166 infants died under one year. The season most fatal was during the months of July, August, and September.

## DIARRHOEAL DISEASES (DIARRHOEA AND DYSENTERY.)

### *No. of Deaths, 843.*

These diseases were the ninth of the 10 highest causes of death in the Province and towns, and eighth in the cities. They were most prevalent in the cities and towns, consequently the death-rate in those localities was higher than in the rural districts.

The ratio to population was as follows :—

For the whole Province....	.4	per 1,000
“ cities.....	.8	“
“ towns.....	.6	“
“ rural districts.....	.3	“

The young and old are the victims of these complaints, particularly the former, as 624 or 72 per cent. of the whole number of deaths from them were of children under five years of age, and the hot months of July, August, and September, were the most fatal.

## CANCER.

### *No. of Deaths, 614.*

The returns of mortality from this cause in 1887 shew an increase of 174 over the number returned in 1886, which raises it to the tenth place in the list of highest causes of death for the Province. It was not on the list in 1886 and does not appear on the list in the cities and towns, as Fevers and Cholera Infantum still return a larger mortality than Cancer in those localities.

The ratio to population :—

For the whole Province.....	.29	per 1,000
“ cities.....	.5	“
“ towns.....	.3	“
“ rural districts.....	.1	“

It is not within the scope of this Report to endeavor to assign the cause of this steady increase in the mortality from Cancer; that belongs to medical scientists, and should engage their most careful study. It would be interesting to know the actual number of cases of sickness from Cancer, so that the proportion of recovery to fatality could be shewn. Not having the required data to determine this, only the mortality according to age and season can be given. Out of 614 deaths from this cause 471, or over 76 per cent., died between 40 and 80 years of age. The distribution of the deaths throughout the different months of the year was not very varied; the first quarter was the highest, 167 deaths, and the second the least, 143 deaths; the other two quarters were almost alike, 144 and 143 deaths.

## DEATHS BY OCCUPATIONS.

(See Table 24.)

*No. of Deaths, 6373 ; Average Age, 56.8 Years.**(Deaths under the heading "No Occupation Given," numbering 104, are not included in this Table.)*

A change has been made in the construction of this table. In 1886, the deaths by occupations were given by counties only, shewing the number of deaths and average ages. In the compilation of this table, the ages at death of each occupation are given in each quinquennial period of life from 20 years, as well as the aggregate and average ages, therefore the length of life of those engaged in each occupation is plainly pointed out. There was an increase in the number returned in 1887 of 573 over the number returned in 1886.

## CLASS I.—CULTIVATORS OF THE SOIL.

*No. of Deaths, 2,858 ; Average Age, 61.9 Years.*

There was an increase of 182 deaths of farmers and gardeners. Sixty-three per cent., or 1,818 of them, lived to be over sixty years of age, and five were 100 years and over at the time of their deaths. The returns also shew that 319 died under 30 years of age. The mortality between 30 and 60 years was comparatively small.

## CLASS II.—MECHANICS.

*No. of Deaths, 1,111 ; Average Age, 50.8 Years.*

The returns shew an increase of 95 deaths in this class, and the most fatal period was between 20 and 30 years. There was quite a contrast between the ages at death of these mechanics ; five of them, viz., Masons, Millwrights, Shoemakers, Tailors, and Weavers, died at an average age of 57 years, while five others, viz., Moulders, Printers, Painters, Saddlers, Harnessmakers, Tobacconists, Cigarmakers, died at an average age of 40 years. Carpenters were the most numerous, 185 of them having died ; at an average age of 52.4 years, and a larger number died between 20 and 25 years, than in any other quinquennial period. It will be noticed, however, that 108 of them lived to be over 50 years. The occupations of Shoemakers and Tailors are not generally considered conducive to long life, the statistics, however, shew the contrary, as their average age at death was larger than that of the majority of the mechanics enumerated in the list. Few of them died under 30 years of age, 32 lived to be over 70 years of age, and 6 over 80 years of age.

Painters and Printers are the shortest lived of the mechanics. According to the returns, their average age was only a little over 40 years, and most of them died under 30 years ; only 3 reached the age of 75 years.

## CLASS III.—LABOURERS.

*No. of Deaths, 998 ; Average Age, 52.7 Years.*

The average age of labourers was not as large as the average of the whole occupations. Farm labourers were not distinguished in the table from labourers who worked in cities and towns. The latter being more exposed to accidents, etc., were not generally as long-lived as the former. The returns shew that 302 died between 20 and 30 years of age principally in the cities and towns, while the majority of the 441 who died at 60 years and over were farm labourers, or of those working in the rural districts.

---

---

CLASS IV.—BUSINESS MEN, ETC.

*No. of Deaths, 568; Average Age, 48.4 Years.*

In this class are included several occupations which tend to shorten life, viz., Book-keepers, Telegraph Operators, and Lumbermen. Of the 140 Book-keepers and Clerks who died in 1887, 68 died between 20 and 30 years of age, and only 21 lived to be 60 years of age. Telegraph Operators appeared to be the shortest lived; their average age was only 23.3 years. Only the deaths of eight were returned, and they all died under 30 years of age. The dangers and exposures incidental to lumbering caused the average age of those who followed that occupation to be low, viz., 41.2 years.

Merchants numbered 207, and their average age at death was 55.3 years; only 14 died under 30 years, and 101, nearly one-half of them, died between 50 and 70 years of age.

CLASS V.—PROFESSIONAL MEN.

*No. of Deaths, 548; Average Age, 59.2 Years.*

The onerous duties pertaining to the professions of Divinity and Medicine do not appear to have prevented a majority of them from living to a good old age.

Their average ages at death were respectively 64 and 59.4 years, and several of them lived to be 70 years and over. No clergyman was returned as dying under 40 years of age. Lawyers lives were not so long, 10 of them out of the 33 who died in 1887 were under 30 years of age, and only 7 reached the age of 60 years and over.

The average age of Public Officials, 59.0 years, was considerably over the general average age. Fifty-four of the 91 that died in 1887, were 60 years and over at the time of their death, and only 9 died under 30 years of age, therefore it is evident that official employment does not shorten life. The returns shew that 33 female teachers died at the early average age of 32.7 years, 19 died under 30 years of age, though two lived to be over 60 years. It must not, however, be forgotten that many female teachers leave the profession in early life, either for the purpose of marrying or entering into some other occupation.

CLASS VI.—OTHER EMPLOYMENTS.

*No. of Deaths, 147; Average Age, 52.8 Years.*

The deaths returned under "Volunteers, Soldiers, etc.," were chiefly those of pensioners of the British Army and Navy, who settled in Ontario after completing their term of service.

The table shews that of the 54 deaths of these pensioners, etc., 34 died when over 70 years of age, 3 at 95 years, and 1 at over 100 years; their average age was 70.7 years, the highest average age of any occupation.

Accidents on railways were the cause of many of the deaths of Railway Employées, and half of them died under 30 years of age; only 3 lived to be 70 years.

CLASS VII.—FEMALES AT WORK.

*No. of Deaths, 148; Average Age, 34.7 Years.*

Only two occupations are included in this class, female Servants and Milliners and Dressmakers. Those who died while engaged in these occupations generally died young. The table shews that out of a total of 148 deaths in this class, 86 died under 30 years of age, and only 28 lived to be 50 years of age.

I have the honour to be, Sir,

Your obedient servant,

H. S. CREWE,  
Inspector.
